

Personal AI Assistant

Installation

A hands-on hour. Laptops open — you are building this with me, not watching.

Before we start

Four things. Three of them you already have.

- **Claude, on your laptop**

The desktop app, signed in.

- **Obsidian**

Free, five minutes. It reads your vault — and creates the folder for you.

- **Somewhere to keep it**

C:\AI is a good home. Nothing to create yet.

- **Nothing else**

No Python, no terminal, no account, no plugin.

What you will have when you leave

Not a demo you watched. An architecture on your own laptop — and the grip to keep building on it.

Your work has a place to live

Written once, in plain text you own. Not re-typed into a chat window every morning.

An organisation that works for you

Departments for the parts of your job. An executive answering for each, specialists under them.

A way to keep building

Agents, skills, workflows, projects. One of each by the end — so the next one is just more of the same.

All of it yours, on your own machine, needing nobody afterwards.

This is not being built for you. It is being built for the agents.

Not a nicer set of notes — a structure an LLM can read, navigate and act on. Readable by a person is the side effect.

ONE HOME

A fact lives in one place

No agent ever has to choose
between two versions of the truth.
Neither do you.

FIELDS, NOT PROSE

Every note is labelled

Fields it can filter and count,
instead of guessing from prose.

THE GRAPH

Linked, never copied

The graph is how it finds context.
Copy-paste breaks it.

Obsidian: worth the five minutes

Obsidian stores nothing. It reads a folder — and creating a vault makes that folder for you.

WHAT IT GIVES THE AGENTS

Retrieval that actually works

Backlinks and the graph give an agent something to walk: client, to promise, to the workflow that delivers it.

Plus Dataview and the rest of the plugin shelf.

IF YOU SKIP IT TODAY

Everything still works

An ordinary folder under C:\AI runs every step of this hour.

What you lose is the graph, the backlinks, the plugins. Install it tonight and nothing gets redone.

1 Create your vault

DO THIS NOW

In Obsidian: Create new vault. Put it under C:\AI. No Obsidian? An empty folder there instead.

You will know it worked when Obsidian shows an empty vault, and the folder exists on your disk.

WHY A FOLDER AND NOT AN APP

Because you keep it

Plain text files in a folder. No database, nothing hosted. Every file of it opens in Notepad, today and in ten years.

2

Make a project, and connect the vault

DO THIS NOW

Create a project in Claude. Connect the folder you just made to it, and approve it.

You will know it worked when Claude tells you the folder is connected and can list what is in it — nothing.

WHY A PROJECT AND NOT A NORMAL CHAT

Because a project remembers

Every conversation inside it reads and writes the same folder. Next week starts where today ended.

3

Ask for the setup

DO THIS NOW

Type the sentence below into your project. Then watch Obsidian.

You will know it worked when Claude reports back, and Obsidian fills with folders as it runs.

Set up the AI Operations Framework in my connected folder.

Pull it from github.com/MeshPro-iPaaS/ai-ops-framework and run the install.

It asks one question: what to call your executives. Job titles, Norse gods, Friends, the Kardashians — or your own.

If it says it cannot run programs on your computer: “then copy the starter folder into mine instead.”

4

Open your dashboard

DO THIS NOW

Say: open my dashboard. Claude finds the page it just built and opens it.

You will know it worked when a page opens with four tabs: Dashboard, Agent organization, Workflows, Projects.

WHERE IT ACTUALLY IS

A file in your own folder

05-Operations / picture / ai_operations.html. No internet needed. Bookmark it.

WHY IT IS TRUSTWORTHY

It was counted, not typed

Every number was counted off your notes. Nobody maintains it, so it cannot quietly go stale.

Everyone should be looking at this

DashboardAgent organizationWorkflowsProjects

What needs you, and how it is running

built 2026-09-23 · 15 checks green

Waiting on you

Named, not counted — with what each one waits for and what happens if nothing is done.

Nothing is waiting on you. Every department has an executive and a workflow, everything written down has an owner, and no decision is sitting unmade.

Where it stands

Counted from the notes at build time. Nothing here was typed in.

2 departments	3 executives	0 specialists	10 workflows written down	8 running end to end	0 projects	25 notes in the vault
------------------	-----------------	------------------	---------------------------------	----------------------------	---------------	-----------------------------

Four tabs

Dashboard, agent organization, workflows, projects.

Honest on day one

Two departments, three executives — and it says so. Your job is next.

5 Name your departments

DO THIS NOW

Tell Claude the parts of your job. Three to six, in your own words.

You will know it worked when one note per department appears, each with an executive attached to it.

WHAT COUNTS AS ONE

A part of your job you answer for

The accounts. The reporting. The posting. The thing you inherited.

THREE TO SIX

Not twelve

If two would never disagree, they are one. Add another next week in a sentence.

Executives own a department and operate it

Each department note compiles into an agent that answers for that department and nothing else.

IT ANSWERS

For one department

It knows its own notes, workflows and what is outstanding. Anything else, it hands back.

IT PREPARES

It does not decide

Drafts and assessments.
Publishing, sending and spending stay yours.

IT STOPS

Somewhere stated

Every executive writes down what it does not own. That is what makes its answers worth having.

Add a department next month and you get another one — same sentence, no setup.

That is an executive layer, and it is yours

Nobody drew this. It is read off the role notes and redrawn every time the site is built.

6 Teach an executive a skill

DO THIS NOW

Say: teach [executive] a skill for this. Then describe how you do it.

You will know it worked when a skill appears in your vault and the executive reaches for it by name.

WHAT A SKILL IS

Your method, written once

When to use it, the steps, where it stops. So it works your way, not its own.

HOW YOU KNOW YOU NEED ONE

You explained it twice

The second time you type the same guidance, it should have been a skill the first time.

7

Give an executive a specialist

DO THIS NOW

Say: add a specialist under [executive] that does [one narrow job].

You will know it worked when a dashed box appears under that executive — its own agent, with one job.

NARROW ON PURPOSE

One job, done properly

Spots quiet accounts. Drafts the post. Writes the first pass. Anything else, it hands straight back.

THE TEST

A task, not an area

Several kinds of work? That is a department. One fiddly thing that keeps going wrong? That is this.

Workflows and projects belong to a department

A workflow is how work happens. A project is work with an end. Both belong to a department.

Client Work

FREYJA +1 SPECIALIST · 1 WORKFLOW, 0 RUNNING

WORKFLOW	OWNER	THE NOTE	THE WORKFLOW
Answering an Account That Has Gone Quiet Notice an account has not heard from us before they notice, and say something worth reading.	Freyja	note is a draft	partly running

TWO MARKS, NOT ONE

Written down is not working

Is the note true? Only after one real case. Does it run end to end? Different question.

THE NUMBER TO LOOK AT

One workflow, none running

Uncomfortable, true, and nobody had to admit it. It was counted.

Look at what is on your laptop

A vault

plain text, yours

Departments

the parts of your job

Executives

one answering for each

A specialist

one job, done properly

A skill

your method, written once

A dashboard

counted, never typed

None of it phones home. It all still opens if you never speak to an AI again.

FROM HERE

The next one is just more of the same

You have made one of everything. Nothing after today is a new kind of thing.

- **Another department** The moment you notice a part of your job nobody answers for.
- **Another specialist** The second time one job goes wrong the same way.
- **Another skill** The second time you explain the same thing.
- **A schedule** When you want the week closed on Friday without being asked.

Monday: open the project, not a new chat. That is the whole habit.
