

Personal AI Assistant

Installation

A hands-on hour. Open your laptop: you are building your own AI Second Brain with me, not watching me build one.

Before we start

Four things. Three of them you already have.

- **Claude, on your laptop**

The desktop app, signed in. This is where every step happens.

- **Obsidian**

Free, five minutes to install. It is how you read and edit your vault — and creating the vault makes the folder for you.

- **Somewhere to keep it**

C:\AI is a good home. Nothing to create yet; step one does it.

- **Nothing else**

No Python, no terminal, no account to create, no plugin to buy.

What you will have when you leave

Not a demo you watched — an architecture on your own laptop, and enough of a grip on it to keep building after today.

Your work has a place to live

Accounts, promises, half-finished drafts — written once, in plain text you own, instead of re-typed into a chat window every morning.

An organisation that works for you

Departments for the parts of your job, an executive answering for each, specialists under them, and skills that hold your method.

A way to keep building

Agents, skills, workflows, projects, schedules. You will have made one of each by the end, so the next one is just more of the same.

Everything you build today is yours, on your own machine, and none of it needs us afterwards.

This is not being built for you. It is being built for the agents.

Your vault is not a nicer set of notes. It is a structure an LLM can read, navigate and act on — written in the shape a machine needs, which happens to also be readable by a person.

ONE HOME

A fact lives in one place

So an agent never has to choose between two versions of the truth — and neither do you.

FIELDS, NOT PROSE

Every note is labelled

Plain-text fields it can filter, count and reason over, instead of guessing from prose.

THE GRAPH

Linked, never copied

The graph is how it finds context. Copy-paste breaks it; a link makes it navigable.

Obsidian: your vault, and why it is worth five minutes

Obsidian does not store anything. It reads a folder — and when you create a vault, it makes that folder for you.

WHAT IT GIVES THE AGENTS

Retrieval that actually works

Backlinks and the graph turn your notes into something an agent can walk: from a client, to the promise, to the workflow that delivers it.

Plus the plugin shelf — Dataview and the rest — which lets a page answer a question instead of just sitting there.

IF YOU SKIP IT TODAY

Everything still works

Make an ordinary folder under C:\AI instead and carry on — the vault is plain Markdown, and every step in this hour runs.

What you lose is the retrieval side: the graph, the backlinks, the plugins. Install it tonight and nothing has to be redone.

1 Create your vault

DO THIS NOW

In Obsidian: Create new vault. Name it after yourself or your team, and put it under C:\AI. No Obsidian? Make an empty folder there instead.

You will know it worked when Obsidian shows an empty vault, and the folder exists on your disk.

WHY A FOLDER AND NOT AN APP

Because you keep it

Everything today is plain text files in that folder. No database, no account, nothing hosted. If we never speak again it still opens — and you can read every file of it in Notepad.

2

Make a project, and connect the vault

DO THIS NOW

In Claude, create a project and name it after your work. Then connect the folder you just made to that project, and approve it.

You will know it worked when Claude tells you the folder is connected and can list what is in it — nothing.

WHY A PROJECT AND NOT A NORMAL CHAT

Because a project remembers

Every conversation inside it reads and writes the same folder. Next week starts where today ended instead of starting from nothing — which is the thing that has been annoying you every morning.

3

Ask for the setup

DO THIS NOW

Type the sentence below into your project. Then watch Obsidian.

You will know it worked when Claude reports back, and Obsidian fills with folders as it runs.

Set up the AI Operations Framework in my connected folder.

Pull it from github.com/MeshPro-iPaaS/ai-ops-framework and run the install.

It asks one question: what to call your executives. Job titles, Norse gods, Friends, the Kardashians — or three names of your own.

If it says it cannot run programs on your computer: “then copy the starter folder into mine instead.” Same vault, one minute.

4

Open your dashboard

DO THIS NOW

Say: open my dashboard. Claude finds the page it just built and opens it in your browser.

You will know it worked when a page opens with four tabs: Dashboard, Agent organization, Workflows, Projects.

WHERE IT ACTUALLY IS

A file in your own folder

05-Operations / picture / ai_operations.html. Nothing is hosted; it opens with no internet. Bookmark it.

WHY IT IS TRUSTWORTHY

It was counted, not typed

Every number on it was counted off your notes when it was built. Nobody maintains it, so it cannot quietly go stale while everyone still believes it.

Everyone should be looking at this

DashboardAgent organizationWorkflowsProjects

What needs you, and how it is running

built 2026-09-23 · 15 checks green

Waiting on you

Named, not counted — with what each one waits for and what happens if nothing is done.

Nothing is waiting on you. Every department has an executive and a workflow, everything written down has an owner, and no decision is sitting unmade.

Where it stands

Counted from the notes at build time. Nothing here was typed in.

2 departments	3 executives	0 specialists	10 workflows written down	8 running end to end	0 projects	25 notes in the vault
------------------	-----------------	------------------	---------------------------------	----------------------------	---------------	-----------------------------

Four tabs

Dashboard, agent organization, workflows, projects.

Honest on day one

Two departments, three executives, and it says so. Not your job yet — that is next.

5 Name your departments

DO THIS NOW

Tell Claude the parts of your job. Three to six, in your own words.

You will know it worked when one note per department appears, each with an executive attached to it.

WHAT COUNTS AS ONE

A part of your job you answer for

The accounts. The reporting. The posting. The thing you inherited that nobody else touches.

THREE TO SIX

Not twelve

If two would never disagree about anything, they are one. You can add another next week in a sentence.

Executives own a department and operate it

Each department note compiles into an agent that answers for that department and nothing else. That is the unit everything else hangs off.

IT ANSWERS

For one department

Ask it about its own ground and it knows the notes, the workflows and what is outstanding. Ask it about somebody else's and it hands the question back.

IT PREPARES

It does not decide

Drafts, assessments, the next version of a note. Publishing, sending, spending and deleting stay yours — that never changes.

IT STOPS

Somewhere stated

Every executive writes down what it does not own. An agent always answers; the stop line is what makes the answers you do get worth having.

Add a department next month and you get another one — same sentence, no setup.

That is an executive layer, and it is yours

Nobody drew this. It is read off each role note — who it reports to, which department it answers for — and redrawn every time the site is built.

6 Teach an executive a skill

DO THIS NOW

Pick something you explain the same way every time. Say: teach [executive] a skill for this, and then describe how you do it.

You will know it worked when a skill appears in your vault, and the executive knows to reach for it by name.

WHAT A SKILL IS

Your method, written once

When to use it, the steps, where it stops. It is why the agent works your way instead of improvising.

HOW YOU KNOW YOU NEED ONE

You explained it twice

The second time you type the same guidance, it should have been a skill the first time.

7

Give an executive a specialist

DO THIS NOW

Say: add a specialist under [executive] that does [one narrow job]. Then rebuild and look at the chart.

You will know it worked when a dashed box appears under that executive — its own agent, with one job.

NARROW ON PURPOSE

One job, done properly

Spots quiet accounts. Drafts the post. Writes the first pass. Anything else, it hands straight back.

THE TEST

A task, not an area

Several kinds of work? That is a department. One fiddly thing that keeps going wrong? That is this.

Workflows and projects belong to a department

A workflow is how a piece of work happens. A project is a piece of work with an end. Both belong to a department, so neither drifts into a pile nobody owns.

Client Work

FREYJA +1 SPECIALIST · 1 WORKFLOW, 0 RUNNING

WORKFLOW	OWNER	THE NOTE	THE WORKFLOW
Answering an Account That Has Gone Quiet Notice an account has not heard from us before they notice, and say something worth reading.	Freyja	note is a draft	partly running

TWO MARKS, NOT ONE

Written down is not working

Is the note true? Only after one real case. Does it run end to end? Different question.

THE NUMBER TO LOOK AT

One workflow, none running

Uncomfortable, true, and you did not have to admit it. It was counted.

Look at what is on your laptop

A vault

plain text, yours

Departments

the parts of your job

Executives

one answering for each

A specialist

one job, done properly

A skill

your method, written once

A dashboard

counted, never typed

None of it needs us. None of it phones home. It all still opens if you never speak to an AI again.

FROM HERE

The next one is just more of the same

You have now made one of everything. Nothing you add after today is a new kind of thing to learn.

- **Another department** The moment you notice a part of your job nobody answers for.
- **Another specialist** The second time one job goes wrong the same way.
- **Another skill** The second time you explain the same thing.
- **A schedule** When you want the week closed on Friday without being asked.

Monday: open the project, not a new chat. That is the whole habit.
